

Java Script

- * Programming language of the web

- * It can change both HTML and CSS

change html content:

- * Most important tag is `getElementById()`

Eg: `document.getElementById("demo").innerHTML = "Hello JavaScript";`

`<button onclick = >Click</button>`
↑
if accepts both " & "

HTML ↑

- * can change HTML styles

Eg: `document.getElementById("demo").style.fontSize = "35px";`

- * can hide HTML Elements

Eg: `document.getElementById("demo").style.display = 'None';`

- * It can show also,

`document.getElementById("demo").style.display = 'Block';`

The script tag: `<script>` → both in Head or body
`<p id='demo'></p>` → body at last is preferred

```
<script>  
    document.getElementById('demo').innerHTML  
        = "My Javascript";  
</script>
```

Javascript Functions:

```
<p id='demo'></p>  
<button onclick='myFunction()'> click  
</button>
```

```
<script>
```

```
    function myFunction() {
```

```
        document.getElementById("demo").
```

```
            innerHTML = "Paragraph changed";
```

```
    }  
</script>
```

External Javascript .js

```
function myFunction() {
```

```
    document.getElementById("demo").innerHTML  
        = "Paragraph changed";
```

```
}
```

HTML :

```
<script src="Javascript.js"></script>
```

JS Output:

1. Using InnerHTML:

```
document.getElementById("demo").innerHTML  
= "<h1>Content</h1>";
```

2. using innerText:

```
document.getElementById("demo").innerText  
= "Content";
```

* We can't change the tag.

3. document.write():

```
document.write(5+6);
```

* Only for testing purpose, it deletes all existing HTML.

4. window.alert():

* Alert box

```
window.alert(5+6);
```

or
alert(5+6);
